

Freedom Systems Software

Freedom Software is a suite of software applications designed specifically for Local Governments' unique management, control and financial needs. The suite is modular and flexible allowing you to start with a basic system and add additional features and functionality as needed. Land Management is another product of Freedom Systems Corp., a leader in providing government software, systems and services.

Permits and Code Compliance (CC)

Permits and Code Compliance is a complete permit management and reporting system for local governments performing this important function. Permit tracking begins with the permit application plan review. Each plan review step is defined and tracked by the system assuring no steps are bypassed. Upon completion, the plan application becomes the master permit record. Each trade permit is defined along with all the inspection requirements to facilitate Inspection Management. Also, all trade permits are linked to the master permit, assuring a complete inspection record before Occupancy Permits are issued. Complete history is maintained by each contractor performing work to provide officials with better insight into contractor performance. In addition, inspection documents and even photo images all can be uploaded to the system providing a complete data and document record.

Inspection Management

Permits and Code Compliance automates all of the routine inspections associated with each particular permit type. Inspection schedules are created for each inspection entity and used to record inspection data for results reporting. Inspection schedules may optionally be downloaded into a Palm® PDA device and used to collect inspection data recorded in the field. Palm devices can also be used to record a photographic record of the site in support of the inspection data. All of this information can be uploaded and attached to the permit and ultimately the land database record providing an important transaction and visual record of land use changes.

Violation Management

Violations identified as part of the inspection process are recorded and tracked by the system. Re-inspections can be scheduled and fees assessed for them if required. All violations become a permanent part of the permit history, even after corrected.

Fee Assessments and Collections

Permits are an important source of revenue needed to fund the expenses associated with the management of this process. Permits and Code Compliance includes a complete and flexible fee charging system which quickly computes charges that can be invoiced and paid directly, billed to the appropriate parties or immediately paid via direct account debit using automated clearinghouse (ACH) or credit card payment functionality.

Fee invoices can be collected as part of an overall centralized cashing function using the centralized cashing system. Any charges created by Permits and Code Compliance are immediately available to centralized cashing for collection. Once collected the fee status is updated in Permits and the appropriate cash and revenue accounts are updated in Financial Management.

Land Database and Mapping Interface

All data available in the Land Database is available for integration with our GIS-based Mapping Management System. Using this approach, complete integration of all land data and geographic information is integrated into a single system for important planning and management functions.
