

Freedom Systems Software

Freedom Software is a suite of software applications designed specifically for Local Governments' unique management, control and financial needs. The suite is modular and flexible allowing you to start with a basic system and add additional features and functionality as needed. Mapping Management is another product of Freedom Systems Corp., a leader in providing government software, systems and services.

Mapping Management (MM)

Mapping Management is a complete Geographic Information System (GIS) for local governments. Mapping Management provides the ability to display a parcel-based map of geographic information tightly integrated with data from all modules used by the municipality. In addition, complete property assessment information is provided by the system.

Municipal Information System

The Municipal Information System provides the ability to search for a parcel by owner name, street, complete address or parcel identification number. Once located, the parcel is visually displayed as a parcel map. Parcel map information can be displayed when viewing information from Land Management or Revenue Management applications. Map information can be printed or shared with other users as needed. Because the system uses true map-based data with the ability to set the buffer distances between properties, automatic generation of adjoining property owner notification is a standard feature of the system.

With Mapping Management, all outstanding payments can be displayed from the Mapping Management System. Many organizations use this feature to assist in collection efforts by viewing this information whenever there is a request for municipal services. And, the payment information is always up to date, assuring the most current status is always known. Mapping can be added to any existing Freedom System application or be

installed with just county-based map and assessment data as the first application.

Land Management Integration

Integration with Land Management provides information about all permit applications, zoning variations, open and closed permits and any code violations reported on the property. Service requests that involve specific property issues are also integrated with the Mapping Management so current status of any request can be viewed from the parcel view of the property.

Revenue Management Integration

Integration with Revenue Management adds the ability to view any municipal services such as water, sewer or trash as well as the current account status of any bills rendered for such services. Usage-based municipal services have the option of adding color coded consumption data to the map as a layer for use as an aid in environmental issues and planning.

Mapping may be integrated with Tax Billing. When used with this system, all current and past tax bills are available for display including current payment status.

Municipal Portal

Freedom Software includes a Municipal Portal that provides seamless integration to all PRISM-e applications including Mapping Management. This customizable portal provides links to other important municipal information such as websites for the county, the state, the Census Bureau and other important sites. This approach allows all municipal information to be accessed from one site using a "user profile" to determine application access privileges.
